DEPI React Frontend Web Developer
Individual training discussion
1 November 2026

Training overview and my contribution

Training	DEPI React Frontend Web Developer
Timetable	120 contact hours plus 39 assignment hours
My contribution	Landing page, profile page and achievements page

Frontend foundations

HTML5 and CSS	12 and 9 hours: meaningful structure and visual layout
UX/UI and Bootstrap	3 and 12 hours: usable flows and responsive components
JavaScript and TypeScript	15 and 6 hours: interaction, asynchronous requests and types
React	33 hours: reusable components, state, props and hooks

Workflow subjects and capstone

Prompt engineering	6 hours: explain the task and verify the output
Backend introduction	9 hours: Node.js, Express and API communication
Quality and collaboration	Code style, documentation/testing and Git/GitHub: 3 hours each
Environment and project work	Docker basics and capstone: 3 contact hours each

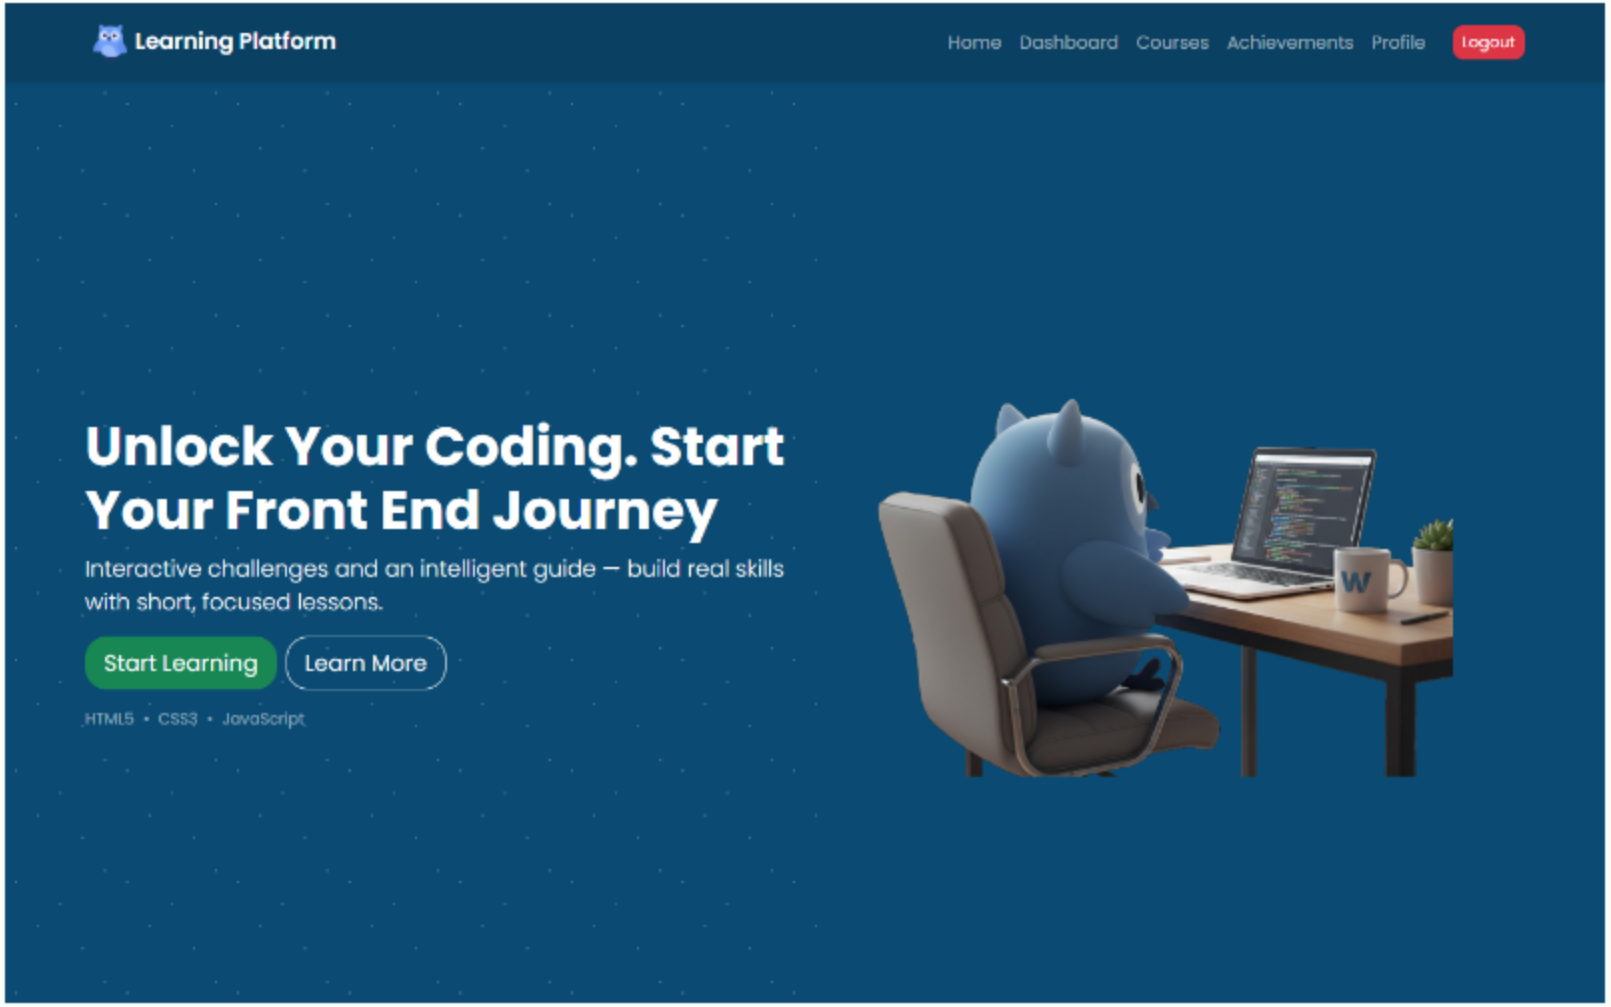

The learning experience we aimed for

Watch, try, and see progress

Our team built a prototype that brings lessons, quizzes and code practice together.

My screens introduce the platform and help learners see their progress.

My landing page

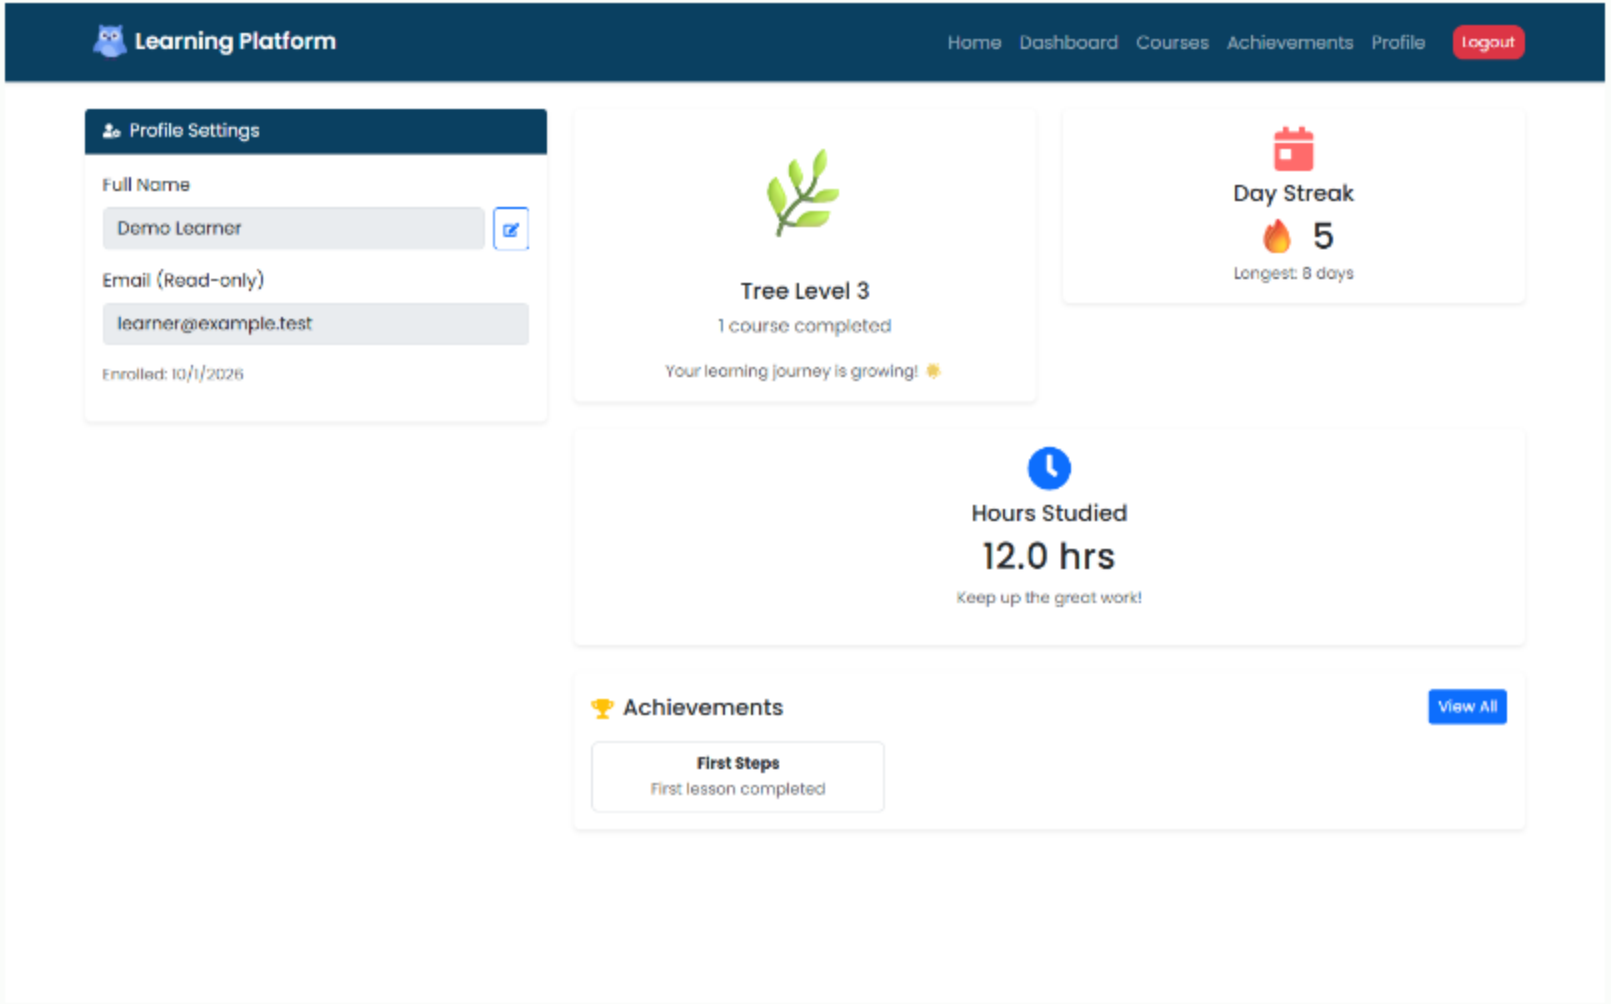

Actual landing page; navigation shown with a sample signed-in user

The learner journey

Discover	The landing page introduces the platform and routes toward courses
Learn	The catalog and lesson player organize modules, videos and practice
Review	The profile brings account information and learning indicators together
Continue	Achievements show earned status and progress toward goals

My profile page

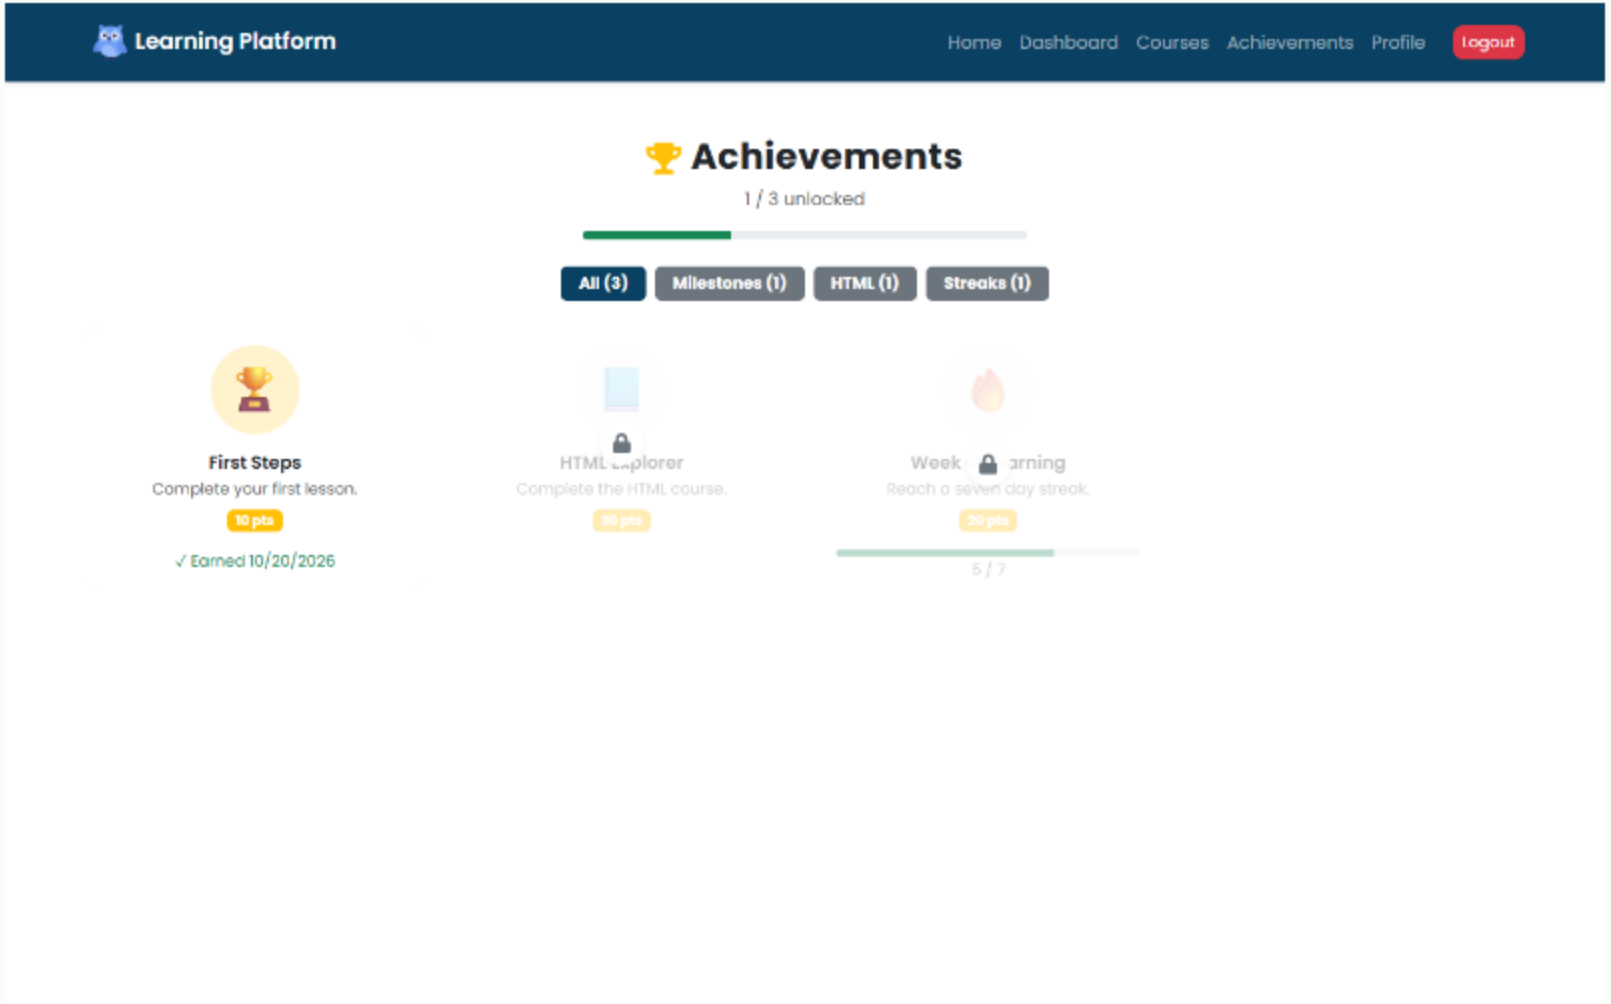

Actual profile screen with sample learner information

Profile editing in React

State	editingName controls the mode; newName stores the draft
Controlled input	The field value and onChange keep the draft in React state
Save	Reject an empty name, then call PUT /api/users/profile/name
Feedback	Success updates the visible profile; cancel restores the saved name

My achievements page

Actual achievements screen with sample earned and locked items

How achievement data reaches the page

Request	The page calls achievementService through Axios
Backend	Express combines achievement templates, badges and user progress
Response	Each item includes earned status and current/required progress
Render	React filters the items and shows labels, locks and feedback

React concepts in my screens

State	Profile data, editing mode and selected achievement category
Effects	Load profile and achievement data after the page mounts
Lists and keys	Render badges and achievements using stable identifiers
Conditional rendering	Show loading, failure, empty and normal content appropriately

Layout, usability and feedback

Responsive layout	Bootstrap rows and columns adapt content across breakpoints
Clear actions	Profile editing offers explicit save and cancel controls
Useful status	Spinners, retry feedback and earned/locked labels explain state
Next improvement	More keyboard and screen reader checks across the full journey

The shared application behind my screens

Frontend	React, TypeScript, Bootstrap and React Router
Communication	Axios services send JSON requests with the session cookie
Backend	Express routes and Mongoose models read and update MongoDB
Access	Authentication identifies the user; authorization limits actions

What I learned and what comes next

Practical skills	Translate a page idea into React layout, state and API-driven content
Integration lesson	UI labels and API responses need a consistent meaning
Prototype boundaries	Some marketing copy and analytics exceed the implemented behaviour
Future work	Accessibility checks, richer practice and the proposed AI/mobile features

Discussion

A clear learner journey

Discover the platform. Learn through a course. Review progress. Explore achievements.

I can explain the React behaviour behind my three screens.

Backup: concepts I can demonstrate

Controlled form	newName is the value; onChange updates it
Immutable update	Copy profileData and its user before replacing name
Derived filtering	selectedCategory chooses all items or one grouped category
Async lifecycle	Set loading, await the service, handle errors, finish loading

Backup: evidence and current scope

Branding	Original owl artwork from the project assets
Screenshots	Actual React pages rendered with sample API responses
Checks	Frontend build succeeded; 11 backend tests passed and 2 skipped
Proposed features	AI tutor, mobile app and study groups remain future work
